

Suggestions - Technological Unemployment:

One of the misleading exhibits in this question is one man operating with ^{new} ~~simple~~ ^{complex} machines. Does ^{who} he stop to think of the number of men that it took to make this machine. They included high grade machinists, they draftsmen, they included ^{men} included/inventors, a long chain. They do not count, ^{from} keeping the thing in order, the repairs, do not count the number of men that it took to produce the materials for this extra machine, nor do they count the number of extra men employed in the new industries which this machine makes possible. It is the machine where ^{man does} one/the work which perhaps a thousand men did before. But how many men did it take to make this possible, to keep it running and how many men have been put to work by the new industry that this made possible.

Something to be studied.
